Product Description

Control power transformers from Schneider Electric set the industry standard for design innovation and performance. They are designed with low impedance windings for voltage regulation, and can accommodate the high inrush current associated with contactors, starters, solenoids, and relays.

A variety of designs are available to meet the diverse needs of panel builders and machinery OEMs. The versatility of the control transformer line offers unparalleled options for design engineers.

The Global Product Offering—Type T

Type T is the most popular and complete line of control transformers. It comes with unmatched design innovations for top performance and is manufactured using the most advanced insulating materials. The Type T control transformer is a solid choice if size and cost are of concern.

Transformers with Fuse Block Protection—Types TF and EOF

We offer both product lines with factory installed overcurrent protection fuse blocks. Type TF and EOF transformers consist of two primary fuse blocks and one secondary fuse block, a configuration that meets the majority of overcurrent needs by panel builders and machinery OEMs. Since the fuse blocks are pre-wired and mounted on top of the transformer, the Type TF and EOF transformers have the same footprint as the Type T unit. This design frees up space normally used for separate fuse blocks.

We also have an extensive fuse block offering for custom applications. See the overcurrent section of this catalog for full details.

Leaded Control Transformer Line

Schneider Electric offers transformers with internally pre-wired 24-inch primary and secondary leads, instead of terminal boards, to make installation easier and faster for many applications. These are only available for single voltage primary and single voltage secondary applications.

MultiTap

Schneider Electric offers Type T transformers in the MultiTap version. The MultiTap control transformer was designed to respond to the increased need for voltage and stock flexibility. It combines multiple primary voltages with one or more secondary voltages, all in a single transformer.

The most flexible MultiTap voltage is the Universal, available on the Type T product line only. It allows for standard primary voltages of 208–600 V and 110, 115, or 120 V secondary voltages.

Type T Transformers

The Type T units are designed for the global market and are a great choice when size and cost are of concern. This is our most popular and complete offering of industrial control transformers. The following features are included:

- 50/60 Hz rated
- Customer installed accessories (FingerSafe™ covers, fuse blocks, fuse clips)
- Type T transformers are designed with various temperature classes:
 - 25–150 VA with a 55°C (131°F) temperature rise, 105°C (221°F) insulation
 - 200–350 VA with a 80°C (176°F) temperature rise, 130°C (266°F) insulation
 - 500–5000 VA with a 115°C (239°F) temperature rise, 180°C (356°F) insulation

Schneider Electric manufactures a wide variety of voltage combinations for control transformers. The voltage combinations are expressed as “Voltage Codes”, and are embedded within the catalog number of the transformer. Standard codes are listed. If the voltage combination you need is not listed, please call your Schneider Electric distributor for assistance.

CE Marking

Industrial control transformers (ICTs) entering the European Union (EU) after January 1, 1997 are required by EU standards to have CE marking or Declaration of Conformity to CE. EU documentation requires compliance with specification EN 61 558 of the Low Voltage Directive. Type T ICTs from Schneider Electric comply with this specification and are third party tested to TÜV standards, which adhere to, and are accepted by, EU standards. A Declaration of Conformity for all Type T units is available upon request.

Because of different overload criteria in the CE specification, Schneider Electric dual rates these transformers for UL VA, cUL VA, CSA VA, NOM VA and CE VA ratings (see "Type T VA Ratings" table). Because they are widely used with control circuit panels, ICTs are also required to comply with EN 60 204 and EN 61 558 in these applications. The Type T transformer line complies with EN 60 204 when FingerSafe™ covers are installed.

For more information regarding CE marking, please contact your local Schneider Electric field sales office.

Type T Transformers Selection Guide

1. Determine inrush and sealed VA of each coil in the control circuit and VA of all other components.
2. Total all sealed VA of all operating coils and other loads VA (determines minimal VA size required for the circuit).
3. Total the inrush VA of all coils that are starting at the same time and all loads and coils that are running (using the regulation chart to give possible units to be used).
4. Take VA size from step 2, go to standard VA size in chart below. Make sure inrush VA from chart is greater than total VA from step 3. If not, go to next larger VA size and repeat.

If supply voltage is stable and fluctuates less than 5%, we recommend use the 90% secondary voltage column. If supply voltage is not stable and fluctuates more than 10%, we recommend use the 95% secondary voltage column. Another recommendation is that one that never use the 85% secondary voltage column since magnetic devices lose life expectancy if they are continuously started at 85% of rated voltage.

Example:

This example assumes the following:

- Two NEMA size 0 contactors do not start together, but one could be ON when the other starts.
 - One NEMA size 2 contactor can start with either of the other contactors.
 - One pilot light at 2 VA
1. VA and inrush are:
 - NEMA 0: sealed 27 VA; inrush 245 VA
 - NEMA 2: sealed 37 VA; inrush 311 VA; pilot light 2 VA
 2. Total VA: $27 + 27 + 37 + 2 = 93$ VA
 3. Total inrush VA: $245 + 311 + 27 + 2 = 582$ VA
 4. From Regulation Chart for Type T at right below:
 - VA minimum unit; inrush 499 VA will not work at 90%
 - VA (next standard size); inrush 666 VA will work at 95%

Table 3 - Regulation Chart for Type T

Custom-Built Type T Transformers

For voltage combinations not listed, Schneider Electric offers custom-built Type T transformers. Type T units are limited to the following:

Primary Voltage Range: 120 to 600 Volts

Secondary Voltage Range:

- 12 to 277 Volts (25 to 1000 VA)
- 12/24 to 277 Volts (25 to 2000 VA)
- 24/48 to 277 Volts (25 to 5000 VA)

	Single	Dual	One Primary Tap (two voltages)	Two Primary Taps (three voltages)	Three Primary Taps (four voltages)	Four Primary Taps (five voltages)
Single	25 VA to 5000 VA	25 VA to 5000 VA	Voltages with 20% 25 VA to 5000 VA Voltages greater than 20% 25 VA to 3000 VA	Voltages with 20% 25 VA to 5000 VA Voltages greater than 20% 25 VA to 3000 VA	25 VA to 3000 VA	25 VA to 3000 VA
Dual	25 VA to 5000 VA	25 VA to 5000 VA	Voltages with 20% 25 VA to 5000 VA Voltages greater than 20% 25 VA to 3000 VA	Voltages with 20% 25 VA to 5000 VA Voltages greater than 20% 25 VA to 3000 VA	25 VA to 3000 VA	25 VA to 3000 VA

Schneider Electric also offers Secondary Tapped units and Multiple Winding Secondary units. Since the sizing of these units are determined by the secondary loading, they are limited to 3000 VA total secondary capacity in the 9070 Type T product.

To request a price quotation from Schneider Electric for a custom-built Type T transformer, use the price quote sheet on page 26.

Figure 24 -

11. Complete the catalog number by replacing the • with the appropriate Voltage Code from *Voltage and Connection Options*, page 25 above.

Multiple Secondary

Designed to meet the needs for both 24 V and 120 V control. Available in the 9070 Type T product line, with all the type T features.

Tapped Secondary D15: 24 V rated for 20% capacity and 120 V rated for 80% capacity when simultaneous loading, or 100% loading when 120 V only.

20% rating at 24 V or 100% rating at 120 V gives equal output current from the device.

VA	24 V amps	120 V amps
50	0.416	0.416
75	0.625	0.625
100	0.833	0.833
150	1.25	1.25
200	1.67	1.67
250	2.08	2.08
300	2.5	2.5
350	2.9	2.9
500	4.17	4.17
750	6.25	6.25
1000	8.3	8.3
1500	12.5	12.5
2000	16.7	16.7
3000	25	25
5000	41.7	41.7

Tapped Secondary D65: Both outputs fully rated for non-simultaneous loading, and simultaneous rated for any combination that does not exceed the nameplate VA rating.

Separate Windings Options: All voltage codes offer fully rated non-simultaneous loading, and simultaneous rated for any combination that does not exceed the nameplate VA rating.

Features of separate windings:

1. Allows two isolated control circuits, 24 V and 120 V, from the same device
2. Wire sizing for circuits for each voltage not highest current for common when simultaneous loading. (no common)
3. If a common is required, it can be obtained with a jumper kit.

Type T Units with Dual 24/120 Volt Secondary (Tapped Units)

Table 28 - Voltage and Connection Options

Type T - Special Quote Request Sheet

Determine VA by Load Requirements

Dual or CT Secondary

Secondary Voltages: ____ x ____ or ____ CT

Amps at higher of the two voltages _____

Tapped Unit

Secondary 1: ____ Volts ____ Amps

Secondary 2: ____ Volts ____ Amps

Secondary 3: ____ Volts ____ Amps

Secondary 4: ____ Volts ____ Amps

Secondary 5: ____ Volts ____ Amps

Separate Windings

Secondary 1: ____ Volts ____ Amps

Secondary 2: ____ Volts ____ Amps

Secondary 3: ____ Volts ____ Amps

Secondary 4: ____ Volts ____ Amps

Secondary Simultaneous Loading?

If Yes: VA Sizing _____

S1: V x A + S2: V x A + S3: V x A + S4: V x A + S5: V x A

If No: VA Sizing _____

Largest VA of the secondary listed above: V x A

Dual Primary ____ x ____ Volts**Tapped Unit**

Primary 1: ____ Volts

Primary 2: ____ Volts

Primary 3: ____ Volts

Primary 4: ____ Volts

Primary 5: ____ Volts

Technical Data

Regulation Requirements: ____ VA @ ____ PF for ____ % Voltage Drop

BTU Requirements: ____ No Load Max ____ Total Full Load Max

Dimensions

If dimensions are critical, provide them below (or supply a drawing with dimensions clearly marked):

Maximum size in inches: ____ H ____ W ____ D

All units will have standard Type T features:

Temperature Rise, Insulation Material, Terminal Board, cULus and CE Marked,

Footprints for VA frame created above.

Transformers with Leads

Transformers with leads instead of screw terminals are available. The lead length is 24 inches. See the following chart for VA sizes and voltage combinations. Contact your Schneider Electric representative for further details.

Table 37 - Voltage and Connection Options

Voltage Code	Primary Voltage	Connection	Secondary Voltage	Connection
D3	208	Connect to H1 and H2	120	Connect to X1 and X2

Fuse Protection

UL Standards and the National Electrical Code® require primary protection for Control Transformers, and many applications require secondary protection. Historically, the fuse options supplied by transformer manufacturers were designed for Line-to-Line primary (480 V) and Line-to-Neutral secondary (120 V).

Schneider Electric's line of fuse options allows customers to obtain both factory-installed and fieldinstalled fuse blocks. Factory installation saves you time and labor. For both options, the transformer footprint is identical to a Type T transformer of equivalent voltage, because the fuse block is mounted above the transformer or on the transformer terminal blocks. This frees up space normally used by separate fuse blocks.

Schneider Electric offers the most complete offering of fuse options to meet all applications for protection of the transformers and load applications. These are broken down into Line-to-Line and Line-to-Neutral protection options for both primary and secondary. Due to space limitations of the transformers, not all options are available for every VA size. Also, all fuse blocks supplied by Schneider Electric are 30 A fuse blocks, which limits the VA for each voltage.

All primary fuse blocks supplied by Schneider Electric require rejection style fuses. Rejection style fuses offer 100,000 AIC protection to comply with UL Standards. (Non-rejection style primary fuse blocks are available by request only and can be quoted through your Schneider Electric field sales office.)

Primary			Secondary	
Voltage	VA Range without Primary Protection	VA Range with Primary Protection	Voltage	VA Range with Secondary Protection
550/575/600	25–5000 VA	25–5000 VA	277	25–5000 VA
440/460/480	25–5000 VA	25–5000 VA	220/230/240	25–5000 VA
380/400/415	25–5000 VA	25–5000 VA	208	25–5000 VA
277	25–5000 VA	25–3000 VA	110/115/120	25–2000 VA
220/230/240	25–5000 VA	25–3000 VA	48	25–1000 VA
208	25–5000 VA	25–2000 VA	24	25–500 VA
110/115/120	25–2000 VA	25–1500 VA	12	25–250 VA

Table 39 - Matrix for Choosing Proper Fuse Configuration

	Primary Line-to-Line	Primary Line-to-Neutral	Primary Without Protection
Secondary Line-to-Line	No factory installed option	Type TF with R12	S22
Secondary Line-to-Neutral	Type TF	Type TF with R11	S12
Secondary Without Protection	Type TF with R02	Type TF with R01	Type T product line
Primary voltages requiring Line-to-Line protection:		200/208/220/230/240/380/400/415/440/460/480/550/575/600	
Primary voltages requiring Line-to-Neutral protection:		100/110/115/120/277/347 Europe: 220/230/240	
Secondary voltages requiring Line-to-Line protection:		208/220/230/240	
Secondary voltages requiring Line-to-Neutral protection:		120/277 Europe: 220/230/240	

NOTE: The following secondary voltages could be either Line-to-Line or Line-to-Neutral: 12/24/48.

Applications for Line-to-Line Primary protection and Line-to-Line Secondary protection,

Example would be 480 to 120/240 (Voltage Code D31)

Available as field-installed only for 9070 Type T

Must order one 9070FB2A(B)—Primary

Must order one 9070S22A(B)—Secondary

Application for Line-to-Line Primary protection and Line-to-Neutral Secondary protection

Example would be 480 to 120 (Voltage Code D1)

Available as factory- and field-installed

Factory-installed—9070 Type TF or 9070

Field-installed—9070 Type T: 9070FB3A or 9070FB3B

Application for Line-to-Line Primary protection and No Secondary protection

Example would be 480 to 24 (Voltage Code D2)

Available as factory- and field-installed

Factory-installed—9070 Type TF with R02 suffix or 9070 Type EOF with R02 suffix

Field-installed—9070 Type T: 9070FB2A or 9070FB2B

Application for No Primary protection and Line-to-Line Secondary

Example would be 480 to 120/240 (Voltage Code D31)

Primary protection done elsewhere in the circuit

Available as factory- and field-installed

Factory-installed—9070 Type T

Field-installed—9070 Type T: 9070S22A or 9070S22B

Application for Line-to-Neutral Primary and Line-to-Line Secondary

Example would be 277 to 120/240

Available as factory- and field-installed

Factory-installed—9070 Type TF with R12 suffix or 9070 Type EOF with R12 suffix

Field-installed—9070 Type T: 9070R12A or 9070R12B

Application for No Primary protection and Line-to-Neutral Secondary

Example would be 480 to 120 (Voltage Code D1)

Primary protection done elsewhere in the circuit

Factory-installed options

1. 9070 Type T with S12 suffix Secondary fuse block; midget-type fuses
2. 9070 Type T with SF25 suffix Secondary fuse block; glass-type fuses
3. 9070 Type T with SF41 suffix Secondary fuse clips mounted on terminal block

Field-installed options

1. 9070 Type T:
Midget-type fuse block: 9070FB1A or 9070FB1B
Midget-type fuse clips: 9070SF41A or 9070SF41B (Limited to single secondary only)
Glass-type fuse holder: 9070AP2

Application for Line-to-Neutral Primary and Line-to-Neutral Secondary

Example would be 277 to 120 (Voltage Code D4)

Factory-installed—9070 Type TF with R11 suffix or 9070 Type EOF with R11 suffix

Field-installed—9070 Type T: 9070R11A or 9070R11B

Application for Line-to-Neutral Primary and No Secondary

Example would be 277 to 24 (Voltage Code D24)

Factory-installed—9070 Type TF with R01 suffix or 9070 Type EOF with R01 suffix

Field-installed—9070 Type T: 9070R01A or 9070R01B

Table 40 - Fuse Protection Options

Protection	Example	Factory Installed Option(s)	Field Installed Option(s)
Line-to-Line Primary and Secondary	480 to 120/240 (Voltage Code D31)	Not available	9070FB2A(B) - Primary 9070S22A(B) - Secondary
Line-to-Line Primary and Line-to-Neutral Secondary	480 to 120 (Voltage Code D1)	9070 Type TF or 9070 Type EOF	9070 Type T: 9070FB3A or 9070FB3B
Line-to-Line Primary and No Secondary	480 to 24 (Voltage Code D2)	9070 Type TF with R02 suffix or 9070 Type EOF with R02 suffix	9070 Type T: 9070FB2A or 9070FB2B
No Primary and Line-to-Line Secondary	480 to 120/240 (Voltage Code D31)	9070 Type T	9070 Type T: 9070S22A or 9070S22B
Line-to-Neutral Primary and Line-to-Line Secondary	277 to 120/240 (Voltage Code D60)	9070 Type TF with R12 suffix or 9070 Type EOF with R12 suffix	9070 Type T: 9070R12A or 9070R12B
No Primary and Line-to-Neutral Secondary	480 to 120 (Voltage Code D1)	9070 Type T with S12 suffix Secondary Fuse Block - midget fuses 9070 Type T with SF25 suffix Secondary Fuse Block - glass type fuses 9070 Type T with SF41 suffix Secondary Fuse Clips mounted on terminal block	9070 Type T: Midget type fuse block: 9070FB1A or 9070FB1B Midget type fuse clips: 9070SF41A or 9070SF41B (Limited to single secondary only) Glass type fuse block: 9070SF25A or 9070SF25B Glass type fuse holder: 9070AP2 Side mounted 2-inch x 9/16-inch: 9070AP1
Line-to-Neutral Primary and Line-to-Neutral Secondary	277 to 120 (Voltage Code D4)	9070 Type TF with R11 suffix or 9070 Type EOF with R11 suffix	9070 Type T: 9070R11 or 9070R11
Line-to-Neutral Primary and No Secondary	277 to 24 (Voltage Code D24)	9070 Type TF with R01 suffix or 9070 Type EOF with R01 suffix	9070 Type T: 9070R01A or 9070R01B

Table 41 - Description of Accessory Keys

Catalog Number		Description
Accessory Key I	Accessory Keys II, III, IV	
9070FB2A	9070FB2B	Two-pole fuse block with rejection clips for primary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070R10A	9070R10B	One-pole fuse block with rejection clips for primary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070FB3A	9070FB3B	Three-pole fuse block, two poles with rejection clips for primary fusing and one pole standard clips for secondary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070R11A	9070R11B	Two-pole fuse block, one pole with rejection clips for primary fusing and one with standard clips for secondary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070R12A	9070R12B	Three-pole fuse block, one pole with rejection clips for primary fusing and two poles standard clips for secondary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070FB1A	9070FB1B	One-pole fuse block with standard clips for secondary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070S22A	9070S22B	Two-pole fuse block with standard clips for secondary fusing, field mounted on terminal board via Fingersafe cover, 1-1/2-inch x 13/32-inch midget fuse
9070SF41A	9070SF41B	Secondary fuse clips mounted on terminal board, prevents the use of Fingersafe covers, only field installable on single voltage secondary units, 1-1/2-inch x 13/32-inch midget fuse
9070SF25A	9070SF25B	One-pole fuse block with standard clips for secondary fusing, field mounted using Fingersafe cover notches, prevents the use of Fingersafe covers, 1-1/4-inch x 1/4-inch glass fuse
9070AP1	9070FB	One-pole fuse block with standard clips for secondary fusing, field mounted next to transformer using same mounting hardware, 2-inch x 9/16-inch fuse
907AP2	9070FB	One-pole twist fuse block with standard clips for secondary fusing, field mounted next to transformer using same mounting hardware, 1-1/4-inch x 1/4-inch glass fuse

Table 42 - Fuse Sizing, Description, and Catalog Number (by manufacturer)

Size	Description	Manufacturer		
		Bussman	Littlefuse	Gould-Shawmut
1-1/2-inch x 13/32-inch midget fuse	Time delay, rejection-type, class CC	FNQ-R LP-CC	KLDR KLMR	ATDR ATQR ATMR
1-1/2-inch x 13/32-inch midget fuse	Time delay	FNM; FNQ	FLQ; FLM; FLA	ATQ; TRM; GFN
1-1/4-inch x 1/4-inch	Time delay	TDC-11; MDL; MDQ; MDA	3AG: 313/315 3AB: 326/325	GDL

NOTE:

These fuses are not supplied by Schneider Electric.

This table is provided for primary fusing recommendation ONLY. Secondary fusing must be specified by the customer.

All primary fuse options offered by Schneider Electric require rejection-type fuses.

NOTE:

Recommended fuse sizes per NEC Article 450-3.

Transformers with primary only, select protection at 125%, if a standard size rating is not available, go to next higher rating.

Transformers with primary only and current rating is less than 9 A, select protection at no more than 167%.

Transformers with primary only and current rating is less than 2 A, select protection at no more than 300%.

Transformers with primary and secondary, select primary protection at not more than 250% and secondary at 125%.

If a standard size rating is not available, go to next higher standard rating.

Primary Fusing to Meet CE

Table 46 - Recommended Fuse Sizes for the PRIMARY (use time delay fuses) for CE Applications

CE VA Rating	Primary Voltage							
	120 V	208 V	240 V	277 V	380 V	416 V	480 V	600 V
25	1/2	3/10	2/10	2/10	1/10	1/10	1/10	1/10
50	1	6/10	1/2	4/10	3/10	3/10	2/10	2/10

Application

In preparation for connecting power to the primary side of dual voltage single-phase transformers, it's necessary to first wire the two windings in either series or parallel to match the incoming voltage. An example of this is common transformers with a primary voltage description of 240 x 480. The windings are rated for the lower of the two voltages show on either side of the 'x'. Connecting the windings in series allows for the higher of the two voltages. Connecting the windings in parallel allows for the lower of the two voltages.

Example of Series and Parallel Connections

Series Connections

Parallel Connections

NOTE: This diagram is for illustration purposes only. Actual units will have different combinations. See diagrams for actual connections.

Example of a typical application

- OEM customer base source voltages in United States: 208, 240, or 480 volts (From past shipments 480 is 65% of the business, 208 is 20%, and 240 is 10%)
- 5% of business goes into Canada and needs 600 volts; customer always knows when equipment goes to Canada.
- Load requirement is for a 500 VA transformer, load is 120 volt control

For this customer, Schneider Electric has the following solutions:

Solution 1

Three standard units with interchangeable dimensions

9070T500D1—240 x 480 to 120; handles 75% of business. For details, see *Voltage and Connection Options, page 11*.

9070T500D3—208 to 120; handles 20% of business. For details, see *Voltage and Connection Options, page 13*.

9070T500D5—600 to 120; handles 5% of business. For details, see *Voltage and Connection Options, page 13*.

Solution 2

Two MultiTap units with interchangeable dimensions

9070T500D20—208/230/460 to 115; handles 95% of business {US Voltage Code}. For details, see *Voltage and Connection Options, page 15*.

9070T500D32—230/460/575 to 95/115; handles 5% of business {North American Voltage Code}; covers 460 and 575 Canadian sources. For details, see , *page 15*.

Solution 3

One Universal Control Transformer

9070T500D50—240/416/480/600 to 99/120/130. For details, see *Voltage and Connections Options, page 17*.

Technical Data

50/60 Hertz

Transformers that are dual rated for 50/60 Hz are truly global units and no derating is required for voltages or VA. (Type T are 50/60 Hz).

Base Plates

The development of welded cores has allowed the incorporation of base plates on larger VA transformers. Base plates are usually welded to the core of the transformer for a solid connection to the transformer. They allow manufacturers to offer more standardized mounting for specific VA sizes by allowing multiple core stacks. Available for Type T transformers only.

Touch-Safe Terminals

Being able to offer touch-safe terminals is increasing in importance. Currently all equipment that must comply with EN 60-204 (Machine and Low Voltage Directives) must have some type of barrier for live parts. Besides the CE standard listed above, domestic customers are requiring barriers on live parts with voltages above 460 V. These customers allow Plexiglas® covers to be installed for these barriers.

Type T transformers can be made finger-safe by using snap-on covers that are removable with a screwdriver or other flat tool. Schneider Electric offers Fingersafe™ covers, which are sold separately. See *Fingersafe™ Covers (not supplied with unit)*, page 46 for ordering information.

Formed Terminal Board

Formed terminal boards are used on multiple VA ranges and different voltage combinations. This allows the manufacturer to punch jumpers for customer interconnections and gives the customer the same basic layout for all units. The snap-on covers for touch-safe terminations also are available on units with formed terminal boards. Available for Type T transformers only.

Varnish Vacuum Impregnation

This is a manufacturing process for the core and coil of industrial control transformers. The transformer is put into a tank of varnish, then the varnish is put into a vacuum, causing the varnish to be forced throughout the coil and core. After being vacuum impregnated, the units are cured in an oven to seal the varnish. The varnish is absorbed by any paper insulation system and coats other insulation with another layer of electrical strength. The process causes the coil to have a very tight connection because it is completely bonded and mechanically very strong. The cores are also tightly bonded with the varnish, causing the units to have better heat transfer and less vibration noise.

Schneider Electric uses this process on all control transformers, using a clear varnish with optimum electrical characteristics.

Frequently Asked Questions

Question	Answer
Should you consolidate your control transformer to a MultiTap or Universal Control Transformer?	When A Multitap Unit Might Be For You: 1. Transformer will be installed in a device whose source voltage is unknown at time of shipment 2. Space is not critical (MultiTaps are larger than standard units) 3. You sell to markets with multiple source voltages 4. Reduced number of parts will offset premium for MultiTap units When A MultiTap Unit Might Not Be Beneficial 1. High percentage of your business is 240 x 480 source voltage 2. Space is an issue 3. Source voltage is always known at time of shipment 4. Source voltage changes other components in the control circuit 5. Premium for MultiTap does not get offset by having fewer parts
Can a 9070 type T or TF control transformer be used in a back (reverse) feed application as a step-up transformer?	No, they cannot. Industrial control transformers terminals are specifically marked "primary" and "secondary". As such, the National Electrical Code (NEC) and Underwriters Laboratories (UL) prohibit connecting the source to other than the primary terminals. Also, since industrial control transformers utilize compensated windings to accommodate the high regulation inherent in such small transformers, the resulting voltage ratio would be lower than desired. In other words, if a control transformer were reverse fed, the output voltage would be lower than desired.
Does Schneider Electric provide fuses for the primary and the secondary of a 9070 Type TF industrial control transformer?	While the 9070 Type TF industrial control transformer comes with a three-pole fuse block (two rejection-type, Class CC fuses for the primary, and one non-rejection-type, midget fuse for the secondary), Schneider Electric does not provide the fuses. Proper fuse selection is the installer's responsibility and is dictated by NEC table 450-3(b) and any specific application parameters that exist with any industrial control transformer installation.
My 9070 Type T or TF industrial control transformer has four terminals on both the primary and secondary, but only markings on the wiring diagram of H1 and H2 on the primary and X1 and X2 on the secondary. Which terminal do I use?	The nameplate of your Schneider Electric 9070 Type T or TF industrial control transformer clearly marks out that the outside terminals of each side are used for the customer installed wire connections. Schneider Electric makes a standard four- or six-terminal block for various transformer designs for commercial cost effectiveness. With only two terminals being used, it is standard practice for it to always be the outside terminals. Several different transformer voltage and wiring arrangements are shown in this catalog.
How do the 9070-FB3A, 9070-FB2A, and 9070-FB-1A fuse blocks mount on a 9070 Type T control transformer when factory installed? When field installed?	When factory installed on a 9070 Type TF control transformer, they mount on the center of the core on factory installed studs. When field installed by the customer on a 9070 Type T control transformer, they mount over one of the terminal strips using hardware supplied with the fuse block kit. (There are no studs on the 9070 Type T, only on the Type TF.)
Does Schneider Electric offer epoxy encapsulated versions of its 9070 Type T and TF control power transformers?	Schneider Electric does not offer epoxy encapsulated industrial control transformers. The 9070 Type T and TF industrial control transformer is the premier offering in the industry and is suitable for virtually any installation appropriate for a CPT.
What is the sound level for a 9070 Type T control transformer?	Sound levels for general purpose and control transformers are per NEMA ST-20 sound levels. For Type T control transformers, this level is 40dB maximum.
Are replacement jumper kits offered for Schneider Electric's 9070 Type T and TF industrial control transformers?	Yes. Replacement jumper kits contain two jumpers per kit and must be ordered in minimum quantities of 50 kits. Use kit number 30033-027-53 for Accessory Key I (25–200 VA) and Accessory Key II (25–150 VA). Use kit number 30033-027-54 for Accessory Key I (250–5000 VA), Accessory Key II (200–3000 VA), and Accessory Key III (25–3000 VA).
Do 9070 industrial control transformers contain any materials, such as PCBs, lead, or other heavy metals, that would require special disposal means	Schneider Electric 9070 Type T and TF industrial control transformers do not contain any material that would require any special disposal means and can be disposed of in the normal manner. Since the majority of the transformer is built of recyclable material (steel, copper, etc.), Schneider Electric urges the customer to recycle the unit if possible.
What does a "triple rating" mean in terms of an industrial control transformers voltage code?	A triple rating on the control transformer's voltage code basically means that the transformer is designed to successfully operate at voltages slightly different than the nominal voltage at its full VA capacity. This is done to allow for different voltage systems that require the same voltage ratios, say 4:1 or 2:1. Example: The 9070T250D1 is a triple rated voltage code unit that can supply 250 VA with the following input voltages and the corresponding output: Input: 240 or 480 Output: 120 Input: 230 or 460 Output: 115 Input: 220 or 440 Output: 110
What is the maximum fuse ampere rating that can be used in a factory or field installed fuse block or fuse clip for a 9070 Type T control transformer?	The maximum ampere rating of the fuse blocks and fuse clips offered by Schneider Electric for the 9070 Type T control transformers is 30 amps. If higher fuse ratings are required, then the customer will have to provide the supplementary fuse holder provisions.
On a 9070 Type T or TF industrial control transformer with more than one secondary voltage available, can	The capabilities of the various 9070 Type T and TF transformers vary widely. Some units can only have one voltage out with a given voltage in. Others can have more than one. Contact your Schneider Electric representative for assistance.

Question	Answer
more than one secondary voltage be utilized or only one?	If a satisfactory model is not available, Schneider Electric has the capability of building virtually any industrial control transformer a customer may need.
What does the CE VA rating mean in selecting a 9070 Type T control transformer?	The CE mark is the official marking required by the European Community for all Electric and Electronic equipment that will be sold, or put into service for the first time, anywhere in the European community. CE VA is the rated capacity of the control transformer according to the CE standard. By bearing the CE marking, a transformer can be sold into any of the participating European countries without having to first clear with that country whether it will accept the UL rating.
An installer had been told by an electrical engineer to ground a 9070 Type T control transformer's frame to the enclosure with a star washer. If this is so important, why does Schneider Electric plate the base of the transformer?	The 9070s base is plated to keep it from rusting. Schneider Electric does not provide grounding provisions on transformer, as grounding is the responsibility of the installer per NEC requirements.
Does a Schneider Electric 9070 Type T or TF industrial control transformer have any continuous overload capacity? What about momentary overloads due to high inrush loads, such as may occur with a coil on a contactor?	Transformers are 100% rated devices. As such, they do not have any continuous overload capacity. They are specifically designed for momentary current draw in excess of their rating for high inrush type loads.
Does a 9070 Type T or TF transformer need to have its impedance listed on its nameplate to be used in any particular area in the world?	Industrial control transformers do not have to list their impedance on their nameplate. They can be used anywhere in the world where their UL, CSA, or CE listing allows, or where they are allowed by the local jurisdiction.
What is the difference between an old 9070 Type K transformer and a new 9070 Type T?	The CE rated, NOM approved Type T transformer replaces the Type K, which is no longer available. The Type T matches the Type K in function and form, but not necessarily in fit, i.e., the dimensions may vary.
Does Schneider Electric offer finger-safe covers for use with 9070 Type T and TF transformer fuse blocks?	The fuse puller accessories (9070FP1) do offer some protection when used and the fuse is in place, however they do not qualify the block for any additional standards. While the fuse block is CE marked, the fuse puller kit does not comply with European standards for finger-safe, as it does not require a tool to remove it. However, this may not be critical as Schneider Electric does not recommend shipping our fuse block or 9070TF to Europe, as the fuses used there are different than those used in North America. Thus, the customer should supply their own fuse block suitable for the European fuses when the transformer is to be used in Europe.
Can a 9070 Type T control power transformer or a general purpose transformer be used to provide power for 24V lighting, 120V to 24V application?	The NEC requires the transformer feeding the low voltage lighting system to be a part of the UL listed lighting system as assembled by the Original Equipment Manufacturer (OEM). A contractor, distributor, or end user cannot assemble their own low voltage lighting system and comply with the NEC without going through UL. If the OEM has a particular transformer listed in their UL file, then that unit may be used. So if the Schneider Electric 9070 Type T device is part of a lighting system that is UL listed, the answer is yes.
